Excerpt: .the relative weights of one molecule of each gas. From his results in chapters XII. and XIII., the student should calculate the number of times heavier a litre of oxygen is than a litre of hydrogen. The figure representing the ratio between the weights of a certain volume of any gas and the same volume of hydrogen, taken as unity, the temperature and pressure being the same, is called the density of that gas. Now, a study of the facts indicates that the molecules of nearly all elementary gases, like hydrogen and oxygen, contain under normal conditions two atoms in the molecule, hence, if the density of a gas compared with hydrogen gives the ratio between the weights of the individual molecules, since each molecule contains two atoms, it will also give the ratio between the weights of the atoms of the two gases. If one litre of oxygen weighs sixteen times as much as a litre of hydrogen; one atom of oxygen will weigh sixteen times as much as an atom of hydrogen. This ratio between the weights of any atom and the hydrogen atom, which is taken as the standard and counted as unity, is called the atomic weight of the element. On the other hand, the ratio that exists between the weight of any gaseous molecule and a hydrogen atom is termed the molecular weight of that gas. It follows, therefore, that in all cases where the element has two atoms...
