The value that is represented by A for the inner coil becomes  $A + 2X + 2g$  for the outer. Likewise B is replaced by  $B + 2X + 2g$ , g being the space occupied by insulation between the coils. If the secondary circuit is open the secondary coil is idle, equivalent to so much air, and all the flux set up by the primary is leakage flux. As the secondary resistance can be replaced by an equivalent primary resistance, == for purposes of calculation, so also the secondary inductance can be replaced by an equivalent inductance in the primary, /., == . These values,  $L_p$  and  $L_3$ , are to be used in the formula at the end of the last section for determining the regulation of a transformer. 54. Exact Solution of a Transformer In the treatment of regulation, efficiency, etc., heretofore, certain small errors have been allowed, due to neglecting the effects of the core, eddy currents, and hysteresis losses. The following graphic solution, adapted from Steinmetz, takes account of all these effects, and is general in all respects. It must first be understood that there are three fluxes to be considered: (1) The useful flux that links both coils. It is not in any definite phase with either / or /, . It is, however, always at right angles to...
